

System with redundancy:

2 components

1 can be repaired keeping system operational

if both fail, system moves from the system working place (green) to the system failed place (red)

numbers 1:Ncomponents (2) are reserved for component working places

numbers (Nc+1):2Nc are then the corresponding component failed places

The first transition numbers should ideally also correspond to the component working places

Other numbers are arbitrary, and can start at any point
